Description: So, while I'm fixing some of the navigation... You can join the conversation by visiting the ACCENT BRISK forum and posting a thread there. The plot I was trying to make really doesn't matter since I'm trying to build the methodology that allows me to call karthik sir from any place and get data back. But in my first draft I had a post that did a remote read and a local write to get the data to the host. It is not robust and I don't need that code anymore. The directions I'm going are: I'm going to have multiple boards that are linked to a single host. I'm going to have a single host that manages the data, handles user's updates (which would be essentially what you suggested). The boards will connect to their host via ethernet. I don't care how the data is represented. It could be IP addresses, MAC addresses, whatever. The data and protocol are known. It is the content that is the unknown. I'm making a name for myself on this site. I have a lot of experience in the protocol itself and on this site, but I have very little experience with Java. I will have to learn some Java as I go. The question I'm asking is whether or not there is a Java package out there that allows this kind of information to be assembled. I am looking for something that can decode the packets that are passed around. I do not want to generate traffic. I'm really confused by your question. What are you trying to achieve? - jwpat7Mar 12 '12 at 14:28 Ya, I would like to find something like that. There are several protocols that can be explained with the ORB (Object Request Broker) which lets you deal with objects from the client. But we are not talking about objects. We are talking about a whole bunch of packets and where they go. I'm not sure I want to write code for that, but I'm not sure if I can actually go that far. - karthikMar 12 '12 at 14:30 I karthik, I have all the relevant data that you want to parse in a JSON string format. I will give you the string for the data in one of the upcoming questions. - jwpat7Mar 12 '12 at 14
